Tutorial 1 – Introduction to Applied AI

Aim:

- Meet your Seminar tutor
- Explore current AI
- Familiarity with the University Generative AI policy
- Think about the limitations and future of AI

Please note that the tutorials take place before each weeks lecture. This first is intended for you to meet your seminar tutor and discuss Artificial Intelligence in a contemporary setting. Take 10 minutes to think of your own answer and then spend 20mins in class discussion for each question.

AI has changed a lot in the last 5 years, from an area mainly studied by academics, to now becoming a household term with wide adoption across a broad cross section of our society.

1. ### What is AI?
   Imagine you are at a party and someone asks you what Artificial Intelligence is? Try to answer the question in your own words. Are LLMs like ChatGPT, Gemini, Claude and many others, all there is to AI?

   Write your own answer first and then explore these questions using Google, ChatGPT and others, and have a class discussion with your tutor.

2. ### How do you use AI?
   Which LLMs do you use and how? (Be honest)
   Read the Generative AI policy. You can find it on the BB – **Guidance for students on the use of Generative AI**

   What is the right way to use AI and why? Do you agree with the Do's and Don'ts?

3. ### What is the difference between human intelligence and today's AI.
   This is an important topic and very contentious today.

   Why do we keep hearing about AGI? Do you believe CEO's of the big AI companies like Sam Altman from OpenAI when they say that AGI is only a couple of years away?

   Are you worried that AI will replace us?

4. ### When do you think Human Level AI will be achieved?
   It is a very frequently asked question with divergent views from a broad cross section of society. Is it mostly hype? Make a prediction based on your own views. It's a good exercise to write your thoughts down and keep them somewhere familiar. Remember to check back every year to see if you were correct.

   End.
